Six plants ot _P. sativum (JI 863) and three plants of P. fulvum (J I 865)) obtained as tetraploids from the John Innes Institute (Norwich, U.K.). were confirmed to be tetraploid ( $2 \mathrm{n}=4 \mathrm{x}=28$ ) 。

Mitotic and meiotic analyses on the progenies of these plants are reported in Table 1. Four plants of the progeny oi a tetraploid of Pisum sativum were $2 \mathrm{n}=28$; meiotic analysis carried out on one ol these plants showed cells with 14 bivalents and cells with quadrivalents (Fig. 1).

The progeny of one $P$. fulvum tetraploid had a chromosome number varying from 28 to 30 ; the meiotic analyses on three of these plants showed associations of four and five chromosomes (Fig. 2) and never 14 bivalents. The presence of two pentavalents in the plants with $2 n_{\sim}=30$ indicates that the two additional chromosomes are different.

Fig. 1. Diakinesis showing $121 I+1 I V$ in the plant "A" of P . sativum with $2 \mathrm{n}=28$.

1 Contribution no. 28 from Centro di Studio per il
Miglioramento Genetico degli Ortaggi-CNR, Portici, Italy

Fig. 2. Diakinesis showing $\operatorname{SIV}+1 \mathrm{~V}+2 \mathrm{II}$ in the plant "A" of P.fulvum with $2 n=29$

Table. 1. Mitotic and meiotic analyses in the progenies of tetraploid plants in Pisum.
